Levers - AWS to GCP Migration

Fournine is responsible for the end-to-end migration of workloads from AWS to GCP. In addition to the migration, Fournine must ensure that Lever's infrastructure and applications achieve SAMA compliance.

The challenge
Lever's existing infrastructure is heavily dependent on AWS services and lacks SAMA compliance. This presents a challenge in migrating to Google Cloud, as it requires decoupling from AWS and ensuring the new GCP setup meets compliance standards.

The solution
Fournine collaborated with the Google Cloud team to set up an account in the Dammam region, a crucial step towards achieving SAMA compliance. Following this, Fournine conducted a comprehensive review of the current AWS infrastructure and designed a new architecture for GCP based on customer requirements. The workloads were then migrated from AWS to GCP in a phased manner, ensuring zero downtime.

The result
Fournine has successfully migrated all workloads from AWS to GCP with no downtime and also get the Levers application SAMA compliant

> We want to highlight the invaluable assistance provided by the Google Cloud and CNTXT teams, along with the patience of our customer, during the account setup. This phase was the most time-consuming and crucial part of our job

About UseLevers
Levers helps B2B companies reduce overdue payments, accelerate cash collection, and boost cashflow.

Vertical/horizontal solution: Financial Services

Primary project location: Saudi Arabia

About Fournine Cloud Solutions Private Limited
Same like this Fournine specializes in making your applications robust, compliant, and cost-efficient
